

# Executive Readout

I analyzed the **Raw Data** sheet from **October 2024 through July 2027**. Volume was measured from **AccountType = Transaction**, while Required HC was summed across all records. Seasonality is based on average demand by calendar month across the available years.

## City-level seasonal highs and lows

Chennai, Clark, Hyderabad, Cochin, and Tarlac are the largest HC locations. Chennai has the highest average monthly volume, while Clark has the highest average Required HC.

The main patterns are

- **Required HC peaks in December** for Clark, Hyderabad, Chennai, Cochin, Tarlac, Mandaluyong, Camsur, Palayan, and Bhopal.
- **Required HC bottoms in July** for Clark, Hyderabad, Chennai, Taguig, Mumbai, Davao, and Ilocos Norte.
- **Volume peaks in October or January** for several India and Philippines locations.
- **Cochin, Camsur, Palayan, and IND WAH show the widest volume swings**, with peak-to-low ratios above roughly 2.3x.
- **Bangalore and PHL WAH show zero forecast volume**, although they still carry Required HC. These should be checked for volume-feed gaps, non-transaction work, or staffing held outside the transaction forecast.

## Overall seasonal profile

At the portfolio level, the largest average forecast-volume months are **October and January**. Required HC is highest in **December**, followed by November and January. September and July are the lowest HC months in the current extract.

The July and September dips should be validated before making permanent staffing reductions. The file ends in July 2027, so calendar-month coverage is incomplete and the account mix may also change over time.

## Seasonal visualization

The first chart shows monthly forecast volume and Required HC for the largest locations. The heatmaps normalize each location against its own average month, making unusually high or low periods easier to identify.

## Cross-skill opportunities

I scored skill pairs within the same city or WAH pool using

- Skill overlap based on common capabilities such as Voice, Chat, Email, Tech Acumen, and Sales Acumen
- Monthly Required HC correlation
- The amount of HC represented by the pair
- Whether the two skills have offsetting peaks and troughs

### Clark

**CX Voice** with **CX Voice&Chat&Email** is the strongest seasonal hedge. The skills have a **-0.94 demand correlation**, with peaks in June and March respectively. This is a good candidate for targeted cross-training because the skill families overlap while demand timing is highly complementary.

**CX Voice&Sales Acumen** with **CX Voice&Tech Acumen&Sales Acumen** also looks attractive. The pair has **67% skill overlap** and a **-0.70 correlation**, suggesting that a blended pool could absorb more seasonal movement.

### Taguig

**CX Voice&Chat** with **CX Voice&Chat&Tech Acumen** has **67% overlap** and a **-0.54 correlation**. This is a practical option for creating a flexible core team, particularly because the first skill has much larger average HC.

### Cochin

**CX Voice** with **CX Voice&Chat** has a **-0.75 correlation**. Although the CX Voice pool is smaller, the overlap between the two skillsets makes this a relatively straightforward cross-skill path.

**CX Chat&Email** with **CX Chat&Sales Acumen** also has good potential, with a **-0.60 correlation** and high combined HC.

### Tarlac

**CX Voice&Tech Acumen** with **Tech Acumen** has **50% skill overlap** and a **-0.49 correlation**. This is especially useful because Tech Acumen is much larger, while the blended skill has a different seasonal profile.

**CX Voice** with **CX Voice&Chat** also has a meaningful complementary pattern and represents a larger operational pool.

### Mumbai

**CX Voice&Chat** with **CX Voice&Chat&Sales Acumen** has **67% skill overlap**. The seasonal correlation is weaker than the Clark and Cochin opportunities, but the high average HC makes this a reasonable second-wave cross-training candidate.

### **WAH pools**

**IND WAH** has a promising pairing between **CX Voice** and **CX Voice&Chat**, with **50% skill overlap** and a **-0.57 correlation**.

**PHL WAH** shows a potentially useful relationship between **CX Chat** and **CX Voice&Chat&Tech Acumen**, but the total HC pool is relatively small. This should be treated as a targeted flexibility opportunity rather than a major capacity lever.

### **Recommended operating actions**

#### **1. Build flexible pools around December peaks**

Because December is the dominant HC peak across many locations, cross-training should be completed before October and November. Clark, Hyderabad, Chennai, Tarlac, Cochin, and Mandaluyong should be prioritized.

#### **2. Use July and September as cross-training windows**

Several locations have their lowest Required HC in July or September. These months could be used for training, nesting, certification, and temporary redeployment without disrupting peak operations.

#### **3. Start with high-overlap, negative-correlation pairs**

The best initial candidates are

**Clark CX Voice ↔ CX Voice&Chat&Email**

**Clark CX Voice&Sales Acumen ↔ CX Voice&Tech Acumen&Sales Acumen**

**Cochin CX Voice ↔ CX Voice&Chat**

**Taguig CX Voice&Chat ↔ CX Voice&Chat&Tech Acumen**

**Tarlac CX Voice&Tech Acumen ↔ Tech Acumen**

These pairings combine practical skill similarity with evidence of offsetting monthly demand.

#### **4. Validate the zero-volume locations**

Bangalore and PHL WAH have Required HC but no forecast volume in the transaction records. Before using them in workforce balancing, confirm whether they support back-office, non-transactional, or externally forecasted work.

#### **5. Use a monthly redeployment rule**

A practical planning rule would be to identify, for each location, the skill with the largest projected surplus in a given month and temporarily redeploy eligible agents into the paired skill with the highest projected gap. This should be constrained by nesting time, language requirements, client certification, and schedule compatibility.

The detailed workbook contains city seasonality, monthly city data, skill-level monthly data, overall seasonality, and the ranked cross-skill recommendations.
